Input connections

H3CR-AP

The start input of the H3CR-AP is voltage input. (Voltage imposition or open)

Voltage Inputs

No-contact Input
(Connection to PNP open collector output sensor)

Operates with PNP transistor ON

No-contact Input
(Connection to NPN open collector output sensor)

Operates with NPN transistor ON

Contact Input

Operates with relay ON

Note: The input circuit is isolated from the power supply circuit. Thus, an NPN transistor can be connected.

Note: Refer to the signal levels in the following table and be aware of the minimum applicable load of the relay.

Note: Before making connections, refer to *Safety Precautions (H3CR-□)*.

Voltage Input Signal Levels

No-contact input	1. Transistor ON Residual voltage: 1 V max. The voltage between terminals 6 and 7 must be 10.8 VDC min.
	2. Transistor OFF Leakage current: 0.01 mA max. The voltage between terminals 6 and 7 must be 1.2 VDC max.
Contact input	Use contacts that can adequately switch 0.1 mA at each operating voltage. The voltage between terminals 6 and 7 with contacts ON or OFF must satisfy the specified value. Contacts ON 100-to-240-VAC and 100-to-125-VDC models: 85 to 264 VAC or 85 to 137.5 VDC 24-to-48-VAC and 12-to-48-VDC models: 20.4 to 52.8 VAC or 10.8 to 52.8 VDC Contacts OFF 100-to-240-VAC and 100-to-125-VDC models: 0 to 10 VAC or 0 to 10 VDC 24-to-48-VAC and 12-to-48-VDC models: 0 to 2.4 VAC or 0 to 1.2 VDC

D: Signal OFF-delay	<p>Basic operation</p> <p>Note: Start input is valid and retriggerable while the Timer is in operation.</p>
E: Interval	<p>Basic operation</p> <p>Note: Start input is valid and retriggerable while the Timer is in operation. (Previous start input will be cancelled.)</p>
G: Signal ON/OFF-delay	<p>Basic operation</p> <p>Note: Start input is valid and retriggerable while the Timer is in operation.</p>

Gate Signal Input (This timing chart indicates the gate input in operating mode A (ON-delay operation).)

- Note:**
1. Allow at least 0.1 s for the Timer reset time if the power supply is reset due to an interruption in the power supply.
 2. The minimum input pulse width (for start, reset) is 0.05 s.
 3. The letter "t" in the timing charts indicates the set time, and "t-a" means that the period is less than the set time. (t - a < t)
 4. In J Mode, there will be only one output even if the start input is longer than the set time.
 5. H3CR-AP model incorporates start input only. As such, the power supply is reset.
 6. Model H3CR-AS only has operation equivalent to time-limit contact: NO.
 7. When the setting dial is turned all the way past 0 for instantaneous output, "t" (set time) in the above time chart is 0-sec operation.
 8. During timer operation, the flash frequency changes when 90% of the set time has been reached.

Note: The set time is the sum of t1 and t2.
Start and reset are also both enabled when the gate signal is ON.

Electrical life curve

情報更新：2024/12/23

Electrical life curve

Reference: A maximum current of 0.15 A can be switched at 125 VDC ($\cos\phi = 1$) and a maximum current of 0.1 A can be switched if L/R is 7 ms. In both cases, a life of 100,000 operations can be expected. The minimum applicable load is 10 mA (100 mA for H3CR-A8E) at 5 VDC (failure level: P).
